The author begins with a presentation of the classicfixed-effects linear model and goes on to illustrate eight commonlinear models, along with the value of their use in statistics.From this foundation, subsequent chapters introduce conceptspertaining to the linear model, starting with vector space theoryand the theory of least-squares estimation. An outline of theHelmert matrix is also presented, along with a thorough explanationof how the ANOVA is created in both typical two-way and higherlayout designs, ultimately revealing the distribution theory.
