There are a number of other digital printing processes that are geared towards specific niche markets: Dye-sublimation is a printing process in which heat is used to transfer a dye onto the substrate. Dye-sub printers are mainly used for printing on textiles, for proofing and for producing photographic prints. Some printers can print on a variety of materials such as paper, plastic, and fabric. In the direct thermal printing process heat is used to

Category:Printing processes. From Wikipedia, the free encyclopedia. Jump to navigation Jump to search. This category represents the primary, mainstream divisions of printing technologies, and not specific methods or designs.[1]. References[edit]. ^ Kipphan, Helmut (2001). Handbook of print media: technologies and production methods (Illustrated ed.). Springer. pp. 42–43. ISBN 3540673261. Read unlimited\* books and audiobooks on the web, iPad, iPhone and Android.Â THE basic principles of the Silk Screen Printing Process are very simple. An especially prepared paint is forced through the open mesh of a piece of silk by means of a rubber blade called a squeegee. The shape of the design or lettering to be printed is formed on the silk by blocking out some parts of the silk mesh and leaving open other parts in the form of a stencil. For example, if we wish to print the letter A, the first step is to tightly stretch a piece of silk on a wooden frame as in Figure 1 (A). Next the shape of the letter A is formed by filling in the mesh of the silk, leaving open
