Highly malignant lymphomas may recur in the meninges. The following indications are currently used in Norway for prophylactic treatment with CNS-active regimens including chemotherapy given intrathecally according to specific protocols: Lymphoblastic lymphoma and Burkitt's lymphoma regardless of stage (Hammersmith-82, BFM regimen). Diffuse large cell B-cell lymphomas, mediastinal large cell B-cell lymphomas, and mature T-cell lymphomas (exception: cutaneous T- and B-cell lymphomas and mycosis fungoides) with at least 4 of 5 of the following risk factors • Tonsils and lymphoid tissue in Waldeyer's ring are considered nodal manifestations. The disease is usually confined and the prognosis is good. The patient should be referred to a university hospital. Four cases of extranodal malignant lymphoma, one each arising in the stomach, salivary gland, lung, and thyroid, are described. These cases have many clinical, histopathologic, and immunohistochemical features in common, and it is proposed that this is because they share a common pattern of histogenesis from mucosa-associated lymphoid tissue (MALT). • Lymphoproliferative diseases (LPDs) of the ocular adnexa encompass the majority of orbital diseases and include reactive follicular hyperplasia (RFH), atypical lymphoid hyperplasia (ALH), and mucosa-associated lymphoid tissue lymphoma (MALToma). Lymphoid follicles (LFs) are usually observed during the histological examination of LPDs.
