The theory of pollution control as it is presented in basic textbooks is fundamentally a theory of point source pollution. Point sources discharge pollutants directly into environmental media (e.g., air or water) from discrete identifiable points where emissions can easily be metered. Sewer pipes or outfalls releasing wastes into streams, or smokestacks discharging plumes into the air are iconic point sources. Air Pollution Control Technology Fact Sheet. Name of Technology: Spray-Chamber/Spray-Tower Wet Scrubber. This type of technology is a part of the group of air pollution controls collectively referred to as â€œwet scrubbers.â€ When used to control inorganic gases, they may also be referred to as â€œacid gas scrubbers.â€ When used to specifically control sulfur dioxide (SO2), the term flue-gas desulfurization (FGD) may also be used.Â Theory of Operation: Spray scrubbers consist of empty cylindrical or rectangular chambers in which the gas stream is contacted with liquid droplets generated by spray nozzles. A common form is a spray tower, in which the gas flows upward through a bank or successive banks of spray nozzles.
