Monotone operators stand at the junction between the study of variational problems, with particular instances related to optimization, game theory and control, on one side, and partial differential equations or quasi-variational inequalities on the other. The expected results catalyzed through this thematic programme have the potential to improve our understanding, industrial processes and ultimately our lives. Special focus of this thematic programme is also given to train the next generation of scientists with an awareness of the interconnections between these important areas. The programme

One of the notions in non-linear functional analysis. Let E be a Banach space, E^* its dual, and let $\langle y, x \rangle$ be the value of a linear functional $y \in E^*$ at an element $x \in E$. An operator A , in general non-linear and acting from E into E^* , is called monotone if $\langle Ax_1 - Ax_2, x_1 - x_2 \rangle \geq 0$ for any $x_1, x_2 \in E$. An operator A is called semi-continuous if for any $u, v, w \in E$ the numerical function $\langle A(u+tv), w \rangle$ is continuous in t . An example of a semi
