Immunotherapy is a relatively new treatment option, and while it hasn’t been FDA approved for breast cancer yet, it’s a promising area. There are several preclinical and clinical studies that suggest that it can improve clinical outcomes for people with breast cancer. Immunotherapy has fewer side effects than chemotherapy and is less likely to cause resistance. Pembrolizumab is an immune checkpoint inhibitor. It’s a type of immunotherapy that has shown particular promise in the treatment of metastatic breast cancer. It works by blocking specific antibodies that make it harder for the immune system to fight the cancer, allowing the body to fight back more efficiently. One study found that 37.5 percent of patients with triple-negative breast cancer saw a benefit from the therapy.
